Experimental Results

Conclusions

Microfluidics:

- Laminar flow regime (no turbulent mixing);
- Surface tension, surface charge become important.

Motivation

The Biological
Microsystem Advantages

Objectives

Lab-On-a-Chip Concept

Lab-On-a-Chip Design
and Fabrication

Experimental Results

Conclusions

Current clinical analysis systems disadvantages:

- Costs;
- Mistake in logistics;
- Delayed results.

Two steps removed

Decreased of the response time and cost

Easily applicable in developing country

Developed country: point-of-care, speed, cost

De Melo. 2007. World lab-on-chip congress

Motivation

The Biological Microsystem Advantages

Objectives

Lab-On-a-Chip Concept

Lab-On-a-Chip Design
and Fabrication

Experimental Results

Conclusions

- **Small components**

- Reduced weight (portable) and size (implantable, integratable);
- Reduced energy consumption.

- **Fabrication**

- Reduced price (disposable).

- **Small amount of samples/reagents**

- Reduced consumption of (expensive/limited) chemicals;
- Reduced production of (toxic) waste;
- Accurate dosing;

- **Complex systems**

- Integration of sensors, parallel process, automation.

- **Device performance**

- Scaling law for new effects and better:
- Increased heat exchange;
- Fast mass transport (rapid analysis).

Main Objective:

- Lab-on-a-chip with fluidic acoustic microagitation to quantify the concentration of the molecules in biological fluids.

Why lab-on-chip?

- Miniaturization can speed up the reaction;
- Hundreds of assays can be performed simultaneously, saving considerable time and effort;

Why using SU-8?

- Low Cost;
- Biocompatible;
- High mechanical strength;
- Good adhesion on many different substrate materials;
- UV lithography semiconductor compatible;
- Very low roughness → suitable for optical absorption measurements.

Major problems with microscale:

- Miniaturization of biological assays is more complex than just transferring reactions to smaller volume;
- Miniaturization in itself does not help to integrate and automate the tests from the biochemical point of view;
- Lack of turbulence;
- Typical Reynolds $< 10 \rightarrow$ Diffusion mixing is dominant.

Experimental Results

Conclusions

Solution:

- Induce the microfluidic die by a mechanism that accelerates the mixing and the reaction, preferably with ANY external apparatus, internal moving parts or valves.

Experimental Results

Conclusions

PVDF:

- Semi crystalline polymer;
- Presents four polymorphs (α , β , γ , δ)
- β -phase is the one which shows better proprieties to be applied in sensors, actuators and transducers, due to its higher piezo-, pyro- and ferroelectrics proprieties;
- Show excellent combination of processability, mechanical stress, chemical agent resistance, lightness, moldability, low cost production and chemically inertness;
- More area, more vibration;
- More thickness, less vibration.

Complete and homogeneous mixing :

- Without agitation $\rightarrow \approx 15$ min at room temperature;
- With manual agitation + 5 min at room temperature;
- Mechanical agitation with macroscopic equipments.

Qualitatively evaluation of
the mixing process:

- Reaction between:
Solution of Sodium Hydroxide,
Sucrose,
Potassium Permanganate.
- Sinusoidal signal with 10V amplitude and
15MHz frequency on β -PVDF transducer ;
- Reaction time improved in 93%.

and Fabrication

Experimental Results

Conclusions

Conclusions:

- *The incorporation of fluidic acoustic microagitation in a lab-on-a-chip is advantageous when two or more fluids need to be mixed;*
- *Experimental show that, at 1 KHz, the mixing time is reduces to 1/3 of the time needed without agitation;*
- *Experimental results show that the thickness and the area of the polymer affects the mixing time of fluids;*
- *Acoustic microagitation becomes a preferred technology for effective mixing and allows the decreasing of the device sizes.*

Support:

- Portuguese Foundation for Science and Technology (grants PTDC/BIO/70017/2006 and POCI/CTM/59425/2004);
- R&D Algoritmi Centre, from University of Minho, Portugal.
